

Climate ACTION PLAN

FOR THE NEW MAYOR OF YORK AND NORTH YORKSHIRE

10 priorities to protect
people and planet

Climate ACTION PLAN

We're facing a climate and ecological emergency – the biggest threat we've ever seen to humanity's existence. The latest report from the UK's Climate Change Committee shows that we urgently need to ramp up delivery of the solutions, and that many of these solutions will require local action. The UK is also failing to build resilience to the worsening impacts of climate change, putting people at growing risk from extreme weather, health issues, food insecurity and more.

Whoever is elected as the next Mayor can't single-handedly solve the crisis, but they must use the powers they have to make as big a difference as possible. They have a very important role to play in providing a guiding vision for the area, and will need to work with councils, businesses, local communities and the national government.

Tackling the climate and nature crisis must be done in a way that benefits everyone, no matter their income, race, age or background. It's important to address the sheer scale of inequalities that exist.

People who are most marginalised – both here in the UK and across the world – have done the least to cause climate breakdown but are the least able to recover from its impacts.

People on lower incomes and people of colour suffer most from the lack of nature and green space in our towns and cities. This is also true of air pollution, despite a lower proportion of people on lower incomes and people of colour owning cars than others.

Young people's futures are most at risk from climate breakdown and the decline of nature, and they're also economically disadvantaged, for example by the cost of housing.

York City Council has a Climate Change Strategy and a Climate Action Plan, with an ambitious target to be a net-zero and climate-resilient city by 2030. However, the council didn't score well in Climate Emergency UK's Council Climate Action Scorecards, which assessed all UK councils on the actions they've taken towards

net zero, although it showed progress in some areas such as heating and buildings. North Yorkshire Council published a Climate Change Strategy in July 2023, but as a newly formed council its actions haven't been assessed in the scorecards. In addition, the York and North Yorkshire Local Enterprise Partnership (LEP), which will now be integrated into the new Mayoral Combined Authority (MCA), has its own Routemap to Carbon Negative and has made some progress on the development of circular economy principles for towns in the area.

It's clear that progress across the area needs to be faster and more comprehensive. The new Mayor must build on existing commitments across the area, accelerate delivery of the actions committed to and tackle inequalities. They must also regularly report on progress towards carbon reduction and nature restoration goals.

This Climate Action Plan will help the next Mayor do this using the devolved powers and funding granted to them. They'll also have an important role in influencing and co-ordinating action by constituent local authorities, local businesses and other stakeholders.

Even with the additional powers and resources already granted to York and North Yorkshire, we acknowledge that some barriers to action remain due to unhelpful national policies, continued reliance on competitive funding streams and inadequate powers to raise funds locally. To address this, the new Mayor should use their voice to campaign for national government to put the climate crisis at the heart of devolution deals and give local government the powers and resources needed to act at the scale required.

10 priorities the new Mayor of York and North Yorkshire should commit to

The 10 priorities listed below build on those we set out for the mayoral elections for city regions in 2021. In the following section, we explain in more detail what each means for the new York and North Yorkshire MCA in practice.

- 1** Ensure all plans, programmes and investment decisions are in line with what's needed to address the climate and ecological emergency and are aligned with international, national, regional and local carbon reduction targets.
- 2** Ensure that the voices of those most impacted by climate breakdown and nature loss are heard and given centre-stage in decision making.
- 3** Invest in and promote new green jobs, and actively facilitate the greening of existing jobs. Protect workers and communities through a just transition to a low-carbon, nature-rich, circular economy, including linking skills training to low-carbon jobs.
- 4** Ensure new housing is zero carbon and served by sustainable transport using their influence on constituent local planning authorities. Use brownfield regeneration and affordable housing funding to deliver zero-carbon homes in locations accessible by public transport and active travel.
- 5** Take a leading role in bringing existing homes in the area up to high energy efficiency standards to reduce emissions and put an end to fuel poverty. Ensure that existing homes are protected from extreme weather events.
- 6** Set targets to at least double public transport use, cycling and walking within the next 10 years. Step up action to meet these targets, including investing in the right infrastructure and working with operators to ensure that public transport services are reliable, affordable and better connected. Support the use of local speed limits that promote the growth of active travel.
- 7** Lead the development, co-ordination and implementation of Local Area Energy Plans (LAEPs) to increase the supply of clean, renewable energy, including supporting community energy initiatives, accelerating the roll-out of heat pumps and encouraging the development of low-carbon district heat networks.
- 8** Produce a Local Nature Recovery Strategy (LNRS) that increases tree cover, protects and enhances nature, stores more carbon in the natural environment, eliminates green space deprivation, and helps the area become more resilient to the impacts of climate change.
- 9** Lead the continued development of a circular economy strategy for the region with local businesses and local authorities to both cut waste and resource consumption and boost the green economy.
- 10** Work with landowners, communities and businesses to promote and deliver the sustainable use of land in York and North Yorkshire.

What this looks like for York and North Yorkshire

1

Ensure all plans, programmes and investment decisions are in line with what's needed to address the climate and ecological emergency and are aligned with national, regional and local carbon reduction targets.

All decisions need to be in line with what's needed to address the climate and ecological emergency. Commitments to tackle the crisis are meaningless if they're contradicted by spending on and support for high-carbon activity. All plans and investment spending must align with the need to cut emissions and increase the resilience of the area to climate impacts. Local government pension schemes must also stop investing in climate-wrecking gas, oil and coal companies.

Practical action

The Mayor must ensure that spending of the mayoral investment fund, and any devolved funding pots under their control like the Shared Prosperity Fund, is aligned with moving to a low-carbon economy.

The Mayor should ensure that all plans, including the Local Industrial Strategy, set the area on a path of fair transition to clean, green industry that will help cut climate change emissions and boost growth in green jobs.

This also means ending the promotion of or investment in high-carbon infrastructure such as new roads. Additional actions to promote low-carbon transport and buildings are set out in the relevant sections below.

The Mayor should make public statements calling on the local government pension scheme to divest from fossil fuels. They should engage directly with the local authorities that control these funds, encouraging them to make immediate commitments to divest from all fossil fuels.

In York and North Yorkshire, the new Mayor will receive an investment of £7 million from the government to "drive green economic growth". They should ensure that this is invested in genuine and effective solutions to the climate and ecological crisis, and that decisions on how to spend it are made in collaboration with the community.

2

Ensure the voices of those most impacted by climate breakdown and nature loss are heard and given centre-stage in decision making.

The Mayor should recognise that those who've done the least to contribute to climate breakdown are often the most vulnerable to its impacts.

In the York and North Yorkshire area, 9 neighbourhoods have been identified by researchers as being particularly vulnerable to surface flooding due to their location and the demographics of the community (for example, age or income). Flooding will be exacerbated by climate breakdown.

Practical action

The Mayor must commit to involving all citizens, but especially young people and the most vulnerable communities, in decision making and action planning. This includes ensuring that official channels of access to the Mayor

and their decision-making officers are open to underrepresented communities. The Mayor should adhere to the principal, "Nothing about us, without us".

The Mayor must also recognise the impact of decisions made today on the wellbeing of future generations and commit to having youth representation on the governance structures within the region.

Deliberative democracy approaches, such as citizen juries, citizen assemblies, and

participatory mapping and budgeting, should be used, especially for complicated or contentious choices and to help with the co-design of policy solutions.

Climate change adaptation and nature restoration spending should be focused on the most vulnerable communities.

3 Invest in and promote new green jobs, and actively facilitate the greening of existing jobs. Protect workers and communities through a just transition to a low-carbon, nature-rich, circular economy, including linking skills training to low-carbon jobs.

Green jobs and training will both be necessary to achieve any credible sustainable vision and economic plan for the region. The green economy is already the fastest growing part of the UK economy, and action in this area will benefit the region.

The Mayor must ensure that the necessary green skills exist in the area to achieve their own and other local transition plans. As early as possible, the Mayor should ensure that sufficient training is available to teach key skills such as fitting insulation and heat pumps, installing electric vehicle charging points and restoring nature. These skills should be a key focus of adult education budget spending.

Practical action

The Mayor should invest in green jobs, apprenticeships and sustainable enterprise. This means prioritising investment in sectors such as renewable energy, housing retrofit, sustainable transport, nature restoration and the circular economy.

The Mayor should use their control of the area's adult education budget to ensure the labour force has the necessary skills to enable the transition to a low-carbon economy, working with businesses, trade unions and

local representatives to understand demand. This includes ensuring that green upskilling is available to workers already active in the economy and supporting self-employed workers to train without loss of earnings.

The Mayor should also work with youth representatives, trade unions, colleges, training providers, businesses and the youth climate movement to devise an ambitious programme of skills training and apprenticeships for the green economy.

4 Ensure new housing is zero carbon and served by sustainable transport using their influence on constituent local planning authorities. Use brownfield regeneration and affordable housing funding to deliver zero-carbon homes in locations accessible by public transport and active travel.

It makes no sense to build new homes today that will need retrofitting in the near future or that are dependent on cars for transport. Although mayoral authorities don't make planning decisions,

they can set out a strategic approach for their area, which can set environmental standards for new development. The Local Plans of the constituent local authorities will then need to be consistent with these strategic policies.

Alternatively, like the Greater Manchester Combined Authority, there's the option to undertake a joint development plan, which also affords additional powers to review the green belt.

Practical action

The Mayor should use their influence to ensure that the new North Yorkshire Local Plan being produced by North Yorkshire Council and the City of York Local Plan are fully aligned with national and regional carbon reduction targets and carbon budgets – including requiring new housing to be zero carbon. All new homes must be wholly free from ongoing reliance on fossil fuels (for instance, for heating), as well as built to high energy efficiency standards. The new Mayor should use the “call in” powers that they’ll be granted to deal with planning applications that don’t meet these ambitions.

The Mayor should also co-ordinate spatial and transport planning at the regional level to ensure that new developments are accessible by sustainable transport, and have access to nature-rich green space.

Funds for new housing such as the Brownfield Housing Fund must be used to deliver affordable, healthy homes that are built to high energy efficiency standards, are protected from overheating and flooding, aren’t built around transport by car, and result in an overall gain in green space and biodiversity.

5

Take a leading role in bringing existing homes in the area up to high energy efficiency standards to reduce emissions and put an end to fuel poverty. Ensure that existing homes are protected from extreme weather events including heatwaves and floods.

Most of the buildings that people will use over the next 50 years have already been built. Only 39% of homes in York and North Yorkshire are currently well insulated. These poor standards drive high energy use and lock households into a dependency on fossil fuels. They also contribute significantly to deprivation, especially since there’s a very clear correlation between poor housing and low incomes, health problems or other vulnerabilities.

29,940 homes need to be insulated every year in York and North Yorkshire to ensure all homes are properly insulated by 2030. It’s estimated that it’ll cost a total of £1.6 billion to get all homes to EPC band C. A significant proportion of this will need to be publicly funded because a large proportion of householders are unable to pay themselves. In addition, the transition from gas-fired boilers to eco-heating systems needs to be well underway in our homes. In York and North Yorkshire, at least 8,220 heat pumps need to be fitted every year until 2030.

As well as ensuring that homes are well insulated to end fuel poverty and improve health, we need to move to electric heating that’s powered by renewable sources. Hydrogen isn’t a sustainable or effective solution for heating homes and shouldn’t have any place in York and North Yorkshire’s net zero plans. In October 2023 the National Infrastructure Commission recommended that government “should rule out supporting hydrogen heating to enable an exclusive focus on switching to electric heating”.

Practical action

The Mayor will have a key role to play in working with local authorities, housing associations and other partners to help to secure government funding to retrofit cold homes that are expensive to heat. The Mayor is uniquely placed to co-ordinate a street-by-street retrofit programme across all types of housing tenures, prioritising neighbourhoods with high levels of fuel poverty.

The Mayor should also support private homeowners and landlords who are able to

pay for retrofit themselves – for example by establishing independent and trusted retrofit hubs for energy saving advice as well as information on financial support and reliable suppliers.

The Mayor should take a leading role in protecting against extreme weather, working with partners across the area to ensure that homes are more resilient to the impacts of climate change such as flooding and overheating.

6

Set targets to at least double public transport use, cycling and walking within the next 10 years. Step up action to meet these targets, including investing in the right infrastructure and working with operators to ensure that public transport services are reliable, affordable and better connected. Support the use of local speed limits that promote the growth of active travel.

In mainland Europe, many places provide much better and more integrated public transport. As a result, levels of public transport use are much higher than in the UK's combined authority areas. Far too few journeys are being made on public transport in York and North Yorkshire. For example, only 7% of commuter journeys are made using public transport. Bus services have declined by 43% when compared with 2010 levels, which is likely to disproportionately impact those on low incomes. In some areas such as Harrogate, on-the-road competition between bus companies hasn't served the public interest, and the current system hinders the integration of services.

York and North Yorkshire must dramatically transform transport infrastructure and travel habits so that using public transport or cycling and walking become the default. Everybody should be able to live decently and get about without having to own a car. In York and North Yorkshire, 18% of households don't have access to a car or van. Access to decent car alternatives is a social justice and cohesion issue, as well as an environmental issue.

Enabling people to get around with minimum impact on the environment will also bring about big improvements in air quality. World Health Organization (WHO) standards are set to reduce the health impacts of air pollution – they're evidence based and regularly updated in line with new research. Our analysis shows that air pollution is a real problem across the area. WHO guidelines for the toxic gas nitrogen dioxide (NO₂) are breached in at least 18 locations, and there are 11 schools in neighbourhoods that have concerning levels of air pollution.

Practical action

The Mayor should use the additional franchise powers gained by devolution to re-regulate buses so that services are improved and delivered by electric buses, fares are affordable,

and routes match what local people need. In addition, there needs to be better join-up across different modes of public transport, such as unified ticketing systems.

The Mayor has a key role to play working with local authorities to co-ordinate the provision of joined-up active travel infrastructure. York and North Yorkshire needs to do much better on providing safe cycling routes. Research shows that with good cycling infrastructure, such as segregated cycleways, and the uptake of e-bikes, 26% of commuter journeys in the region could be made by bike. A comprehensive network of safe, segregated cycle routes should be the goal for urban areas – like those in Copenhagen, Denmark, where 49% of journeys for work and education are made by bike. Efforts should be made to build community support for these changes and to consult in advance about new routes and measures. The Mayor should appoint an “Active Travel

Commissioner,” modelled on similar approaches in other mayoral authorities, to lead and champion active travel plans.

The Mayor must protect the health of local people and commit to taking the necessary action to ensure air quality standards are met across the whole region. This will require measures to stop the use of the most polluting vehicles and to encourage the take-up of electric vehicles, as well as measures to facilitate alternative ways to travel.

Additional money to achieve this transformation in transport can be raised through schemes like the Workplace Parking Levy successfully pioneered by Nottingham City Council.

7

Lead the development, co-ordination and implementation of Local Area Energy Plans (LAEPs) to increase the supply of clean, renewable energy, including supporting community energy initiatives, accelerating the roll-out of heat pumps and encouraging the development of low-carbon district heat networks.

A rapid growth in renewable energy is needed to wean the UK off electricity produced by fossil fuels and to increasingly provide the electricity needed to heat homes, cut fuel bills and power transport. By actively promoting renewable energy like rooftop solar panels, solar farms, onshore wind turbines and some small-scale hydro power, a proportion of this clean and affordable energy can be provided in York and North Yorkshire.

Currently, 282,887 MWh of onshore renewable energy is generated in York and North Yorkshire each year – a very small fraction of what’s needed. This is only enough to power the equivalent of 104,770 homes.

Practical action

The new Mayor should lead the development, co-ordination and implementation of LAEPs for the region, building on and strengthening the existing City of York LAEP and the LAEPs across North Yorkshire developed by the LEP. There must be a clear focus on delivering sustainable energy infrastructure and renewable energy production in partnership with local authorities, communities and energy utilities. Community ownership of renewable energy should be particularly encouraged and supported.

The LAEPs should be linked to the spatial development strategy and Local Plans for the area to ensure that opportunities for new renewable energy generation are identified. The LAEPs should also identify priority locations for the roll-out of heat pumps, including where grid infrastructure can handle these now and where they need to come later. Where heat pumps can be rolled out, the Mayor needs to ensure that delivery is accelerated. There should be no place for hydrogen for heating in the LAEPs, as explained in priority 5.

In addition, all public purchasing of energy should be from 100% renewable power.

8

Produce a Local Nature Recovery Strategy (LNRS) that increases tree cover, protects and enhances nature, stores more carbon in the natural environment, eliminates green space deprivation, and helps the area become more resilient to the impacts of climate change.

Nature in England is in decline. Pressures from farming, pollution and badly located development continue to put our wildlife at risk and undermine the functioning of healthy ecosystems.

Access to quality green space is essential for people's physical and mental health. Green space, trees and other "green infrastructure" are also essential for nature. Friends of the Earth has used official data on green space, gardens and open access land to identify the neighbourhoods most deprived of green space in the area. Nationally, results show that low-income communities and people of colour are worst off when it comes to access to green space. Although access to green space in the York and North Yorkshire area is better than in some other MCAs, there are 7 neighbourhoods rated E (most deprived).

Practical action

In the York and North Yorkshire area, the mayoral authority will become responsible for developing a LNRS. The LNRS should set out how it'll protect and manage nature sites that are important for people and wildlife, as well as restore nature and ecosystems across the area. This includes planting more trees and woods on land owned by local authorities and in partnerships with local landowners. Friends of the Earth has produced a map identifying where new woodlands could be planted outside

of urban areas.

The Mayor should also aim to eliminate green space deprivation. This means ensuring everybody has access to enough quality green space. In some areas this might mean opening up school grounds outside of school hours or converting some streets or carparks into public green space. It also means more extensive use of street trees within streetscapes.

9

Lead the continued development of a circular economy strategy for the region with local businesses and local authorities to both cut waste and resource consumption and boost the green economy.

York and North Yorkshire should aim to create a zero-waste, circular economy – in which resources are used for as long as possible, have the maximum value extracted from them, and are recovered and regenerated at the end of their service life.

Only 44% of household waste in York and North Yorkshire is reused, recycled or composted. Incineration, also called Energy from Waste, isn't a sustainable alternative as it's more carbon polluting than even gas-fired power stations, and it also contributes to local air pollution. The Mayor should use their influence to maximise waste material recovery for reuse and recycling, and reduce the volume of waste being burned.

The Mayor should draw on the expertise of the York and North Yorkshire LEP and work with businesses and community groups to increase the reuse and repair of products in the area. This includes influencing businesses to select more sustainable materials, improve the design of products and extend product life cycles. Circular economy principles should also be applied to local authority procurement of goods.

The Mayor should also support and co-ordinate local authorities in the area to ensure 70% of household waste is reused, recycled or composted by 2025, and to achieve zero waste by 2030. This should include initiatives to reduce food waste and introduce doorstep food waste recycling across the region, and make it easier for people and businesses to stop sending waste to landfill or incineration.

10

Work with landowners, communities and businesses to promote and deliver the sustainable use of land in York and North Yorkshire.

The land area of York and North Yorkshire is over 8,600 km² and makes up over 6% of the land mass of England. How land is used in York and North Yorkshire plays an essential role in the sustainability of the area.

Practical action

In addition to the powers conferred to the York and North Yorkshire MCA to formulate a LNRS for the area, the Mayor should use their convening powers to bring together key stakeholders from across the region, including farmers, landowners, community groups, local authorities (including the National Park authorities) and statutory agencies. Together, they should work to ensure a sustainable,

multifunctional use of land for the area that delivers climate change adaptation and mitigation as well as nature protection and restoration, and that ensures there's space for affordable homes and sufficient food production. The Mayor should ensure that sustainable land use is at the heart of any new joint strategic spatial plan for the area.

Methodology

Friends of the Earth has drawn on official sources of data to identify progress on climate and nature issues in metro mayoral areas. Where official data sources aren't available, we've relied on alternative quality sources. Below we list our data sources and explain what analysis of them we've carried out, if any.

Extreme weather

Professor Sarah Lindley at the University of Manchester has carried out an analysis for Friends of the Earth to identify which small neighbourhoods – Lower Layer Super Output Areas (LSOAs) with an average population of 1,700 – are both likely to be exposed to extreme weather and have demographic/ neighbourhood characteristics that make the population particularly vulnerable. More detail is available on [extreme heat](#) and [flooding](#).

Homes

The number of poorly insulated homes is based on government data on [energy performance certificates](#). There are a range of data sources on the cost of bringing properties up to a decent standard (EPC C level), including the [English Housing Survey](#). The actual costs will be influenced by the approach taken. For example, Friends of the Earth is advocating a street-by-street approach, which is likely to bring cost savings compared with approaches that require retrofitters to consistently travel between jobs. The target number of heat pumps to be fitted is based on the number recommended by the Climate Change Committee for the whole of the UK, adjusted for the number of homes within the metro mayoral region.

Transport

The proportion of commuter journeys by different travel modes is based on 2011 Census data. Unfortunately, more up-to-date data isn't available. However, the situation today is unlikely to be significantly different because of bus service decline outside of London. The data on [bus service decline](#) is from an analysis by the University of Leeds for Friends of the Earth. The data on access to a car is from the [2021 Census](#). The data on the proportion of commuter journeys that could be made by bike is from the [Propensity to Cycle Tool](#).

Air pollution

Air pollution data is based on a Friends of the Earth analysis of [modelling data at 1 km² published by the government](#). Our analysis involved using geographical boundary data for small neighbourhoods (LSOAs) to calculate an average level of air pollution within the neighbourhood and compare this with WHO limits. We've also identified the number of schools within areas with high air pollution levels using government data on school locations. More detail is available on [air pollution](#).

Renewable energy

The amount of onshore renewable energy generated in the region is identified by [government data](#). The calculation of how many homes-worth of energy this equates to is based on [typical household consumption figures](#) published by the energy regulator Ofgem. In future, more renewable electricity will be needed to heat homes and power transport, reducing the usage of fossil fuels. Total energy consumption will reduce in the future as electric heat pumps and electric cars are much more energy efficient than equivalents powered by fossil fuels.

Green space

Friends of the Earth has identified the neighbourhoods deprived of green space by combining government data on public green space, garden size and open access land and ranking neighbourhoods on a scale of A-E. Within this Climate Action Plan, we've referred to E-rated neighbourhoods as green-space deprived. More detail, including the methodology, is available in the [full analysis](#), which was carried out in 2020. The underlying government data we relied on isn't perfect, so ground truthing is necessary. Natural England is working to improve the data and is expected to publish more data in spring 2024.

Waste

Data on household waste recycling is from [government data](#).
